

URBAN FIELD FARM STOP
LOS ANGELES, CALIFORNIA

The Urban Field Farm Stop, a competition entry for which BCV received second runner-up honors, contemplates an innovative distribution system for fresh farm product to urban centers. This new concept envisions the entire city map as an Urban Field of farmers markets integrated directly with the mass transit circulation system of the city. Select bus stops transform into individual Farm Stops to provide farm fresh product to commuters, residents and local trade outlets. The Urban Field of Farm Stops establishes a citywide network of alternate sales points for farmers and a convenient greener alternative to the single venue farmers market. The Farm Stop prototype is a simple modern shelter utilizing sustainable materials. A finely crafted stainless steel frame supports louvered terra cotta rain screen cladding, and photovoltaic cells line the top of the shelter's glass canopy, shading users by day and powering the high efficiency LED lighting by night.
